NETWORK ANOMALY DETECTION (NAD)

Network monitoring • Threat detection • Website security

The Problem

Networks face threats such as:

Port scanning

Brute-force attacks

Denial-of-service attacks

Fast detection helps organizations respond sooner.

Our Solution

NAD combines:

Real-time network monitoring

Signature-based detection

Machine-learning anomaly detection

Website security and uptime monitoring

How NAD Works: Eyes • Brain • Voice

EYES

Capture packets from live interfaces or simulated traffic

BRAIN

Analyze flow behavior with 41 features, signatures, and Isolation Forest

VOICE

Deliver alerts through the SOC dashboard, REST API, and WebSocket

Key Capabilities

- Correlated threat scoring and alert investigation
- 30 documented signature rules
- Traffic analytics and active-flow inspection
- Website checks: uptime, latency, TLS, headers, and security findings
- Simulator, live capture, PCAP replay, and remote telemetry modes

Value & Conclusion

NAD helps security teams:

- **Identify suspicious activity**
- **Investigate security alerts**
- **Improve monitoring visibility and response**

NAD makes network security monitoring more visible, intelligent, and practical.
